

InsightServer[®] 3.5

from Bynari

The Linux Based Mail and Messaging Server

InsightServer 3.5 delivers a Linux based mail services product that provides a functional alternative to Microsoft Exchange and other existing enterprise messaging servers. InsightServer utilizes open standards and a centralized architecture that are superior to these proprietary solutions. This latest version of InsightServer adds additional ease of management, integrated security, and ease of use. Complete Desktop compatibility

Services such as calendaring, shared folders, meeting management, and server side mail stores are fundamental for current enterprise users. InsightServer supports major industry communications standards working with a broad range of corporate mail clients serviced by Microsoft Exchange and other leading mail servers. Users arrange appointments and schedule meetings with other personal information management tools, including Outlook, Entourage and Organizer by employing iCalendar and elements of Microsoft's messaging application program interface (MAPI). Users can share existing company address books through LDAP support, contact and distribution lists and shared folders.

The fully compatible alternative for users of Outlook and Exchange

InsightConnector for easy migrations

With Bynari's bundled new technology; InsightConnector users can utilize facilities across all versions of Microsoft Outlook. This functionality allows for transparent migration for the desktop user and complete compatibility with all versions of Exchange to allow phased, mixed or total migrations. In addition, companies with IMAP servers can use the InsightConnector to allow any Outlook users to have full email and calendaring functionality.

Enhanced Management tools

Enhanced console management functions add the ability to configure mail transfers via Bynari's web-based interface. An InsightServer administrator has more robust configurations options via the web console. Any types of network configurations like

SMTP, logging filters, user management, message configurations and advance configurations are now available with the management console.

InsightServer also allows administrators to minimize downtime while reducing migration tasks or requiring changes to network infrastructures.

Reliability, Ease of use, Cost efficient

InsightServer offers a proven platform for deploying mission critical messaging solutions at an affordable price. Spiraling costs of proprietary messaging and collaboration products from vendors such as Microsoft have caused many organizations to worry about their infrastructures. InsightServer provides significant cost savings for any organization while allowing for network stability. Customers looking for an alternative to legacy software will find Bynari, combined with Linux, a very attractive option whether it is for a single Intel based Server or for large enterprise server consolidation on a server farm or a mainframe. Scaling from a single processor Intel server to the largest of the multi-processor IBM zSeries, Bynari offers unparalleled scalability, interoperability and flexibility. By utilizing Linux, InsightServer and appropriate hardware systems, the total cost of ownership (TCO) is significantly less than using Microsoft mail server and other comparably priced messaging products.

Security

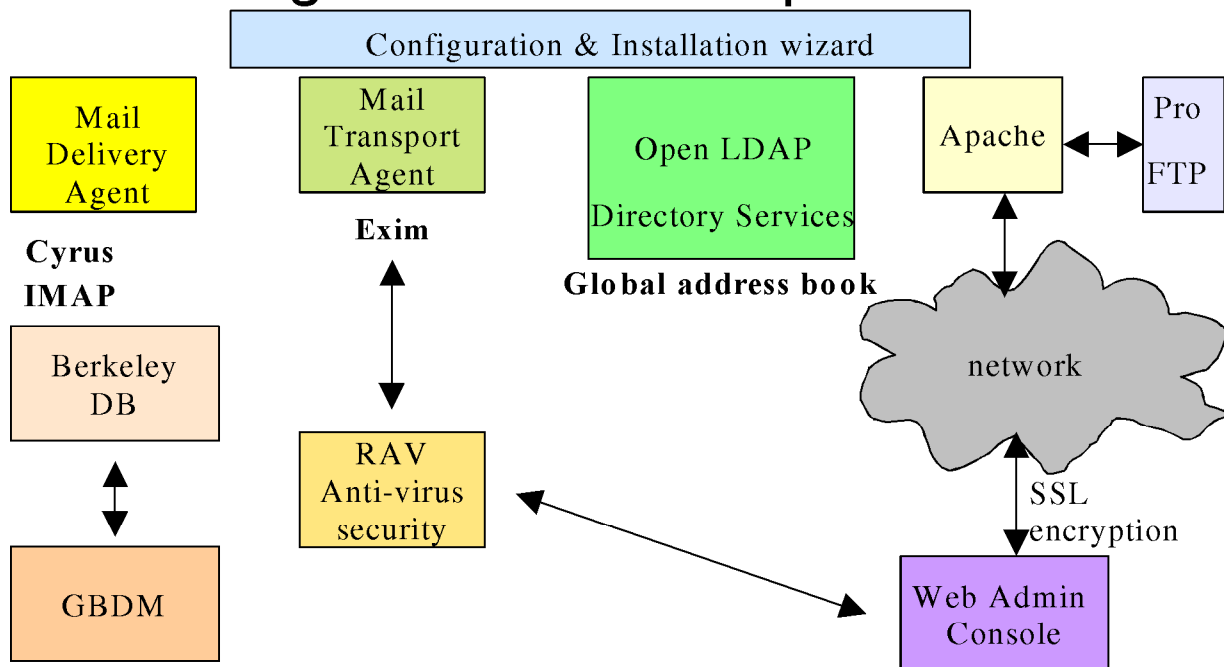

With V3.5, the InsightServer has integrated an anti-virus, anti-spamming, and filtering security software. The security software, RAV is considered to be one of the best security software on the market. RAV is tightly coupled with the InsightServer features, and the management of RAV is integrated into the management console. The Insight Server includes 3 months of usage of the integrated RAV product.

- full Outlook and Exchange compatibility
- integrated antivirus software
- immediate cost savings
- Linux and Open Standards based
- transparent and phased migrations
- Industry leading reliability
- scalable from Intel platforms till mainframe

Technical specifications:

Multi-Protocol Support	Including LDAP, POP3, IMAP, SMTP and Icalendar.
Compatibility	Microsoft Exchange Server functionality while retaining full Outlook compatibility. The InsightConnector eliminates all disruption or replacement of existing Outlook mail clients.
Multi-Platform Server	Support for Red Hat and SUSE on Intel, PPC, AS400 and OS/390 platforms.
Multi-Platform Client	Supports a variety of clients on Windows, MacOS, Linux and other UNIX flavors.
Secure	The InsightServer utilizes both Open Source and third party security applications. Including virus protection, anti-spam filtering, stripping of worms, Trojan horses, VB scripts,...
Scalability	Deployment can vary from 1 Intel based machine till a mainframe serving from 25 till 100.000 users or more.
